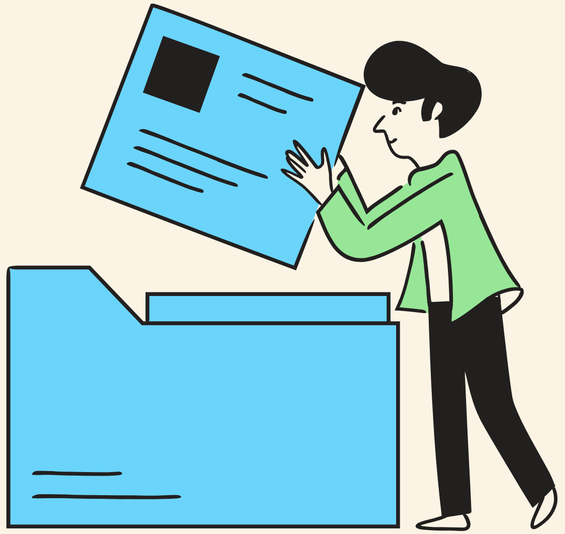
The EUC Hexagrid as a Roadmap to the Future 20

About the Author 21



Introduction: Why EUC Matters

End-user computing (EUC) refers to technologies, products, and services that enable users to get work done securely, productively, and engagingly. EUC empowers businesses by boosting productivity, ensuring agility, and providing secure, consistent access to applications and information, irrespective of location or device. Its effects are visible in three factors:

User Productivity	EUC empowers end users by equipping them with tools that enhance productivity and enable them to achieve more.
Organizational Agility	EUC helps organizations remain creative and agile by enabling employees to adopt and utilize new tools and technologies easily. This capability allows companies to keep pace with change and explore new working methods. EUC creates a more innovative and flexible work environment by streamlining collaboration and idea-sharing. Such flexibility is essential today, allowing businesses to quickly adapt to evolving situations and seize new opportunities.
Data and Endpoint Security	As remote work and BYOD (Bring Your Own Device) usage grows, securing company data becomes increasingly complex. EUC solutions address this challenge by providing centralized device management, secure application access, and consistent enforcement of network and data policies. This approach helps organizations maintain robust security controls, meet compliance requirements, enforce access restrictions, and monitor data usage more effectively, reducing the risk of data breaches and protecting sensitive information.

Today's digital workspace enables employees to work securely and efficiently from anywhere, on any device. Modern web apps—especially Progressive Web Apps (PWAs)—deliver native-like experiences on corporate and BYO devices. With solutions like DaaS, Cloud PCs, enterprise browsers, and zero-trust, users stay secure and compliant—even on unmanaged endpoints—without sacrificing productivity. While this setup fits many use cases, it's not one-size-fits-all. Full virtual desktops and published apps remain vital for many use cases. That's why EUC offers a range of delivery models—from managed physical PCs and virtual desktops to secure browser-based access—tailored to user needs. The focus is no longer on a single workspace for everyone but on delivering the right app in the right way at the right time. EUC is critical for today's organizations. It boosts productivity, secures data, and cultivates innovation, collaboration, and agility—helping businesses reach their full potential and stay competitive.

Glimpses into the future

EUC is not just about new technology but also about embracing the innovations within. We're witnessing several key developments within the EUC ecosystem.

This whitepaper explores the EUC Hexagrid—a unique perspective on the end-user computing ecosystem. The Hexagrid is structured around 6 core pillars and 27 sub-pillars and features over 280 vendors mapped across the landscape. We'll explore its purpose as an essential resource for professionals in the IT field navigating the EUC domain. Topics covered include:

- EUC key themes and their benefits to an organization.
- What is the EUC Hexagrid?
- The unique composition of the EUC ecosystem and its related purposes and benefits.

Artificial Intelligence (AI)

One of the most transformative and new developments in the EUC ecosystem is the rise of Workspace AI. AI is reshaping the digital workspace by automating user and admin tasks, offering real-time insights and advice, fixing issues before they arise, and enabling natural language interaction with apps and systems. It boosts productivity, enhances security, and makes collaboration across teams and time zones seamless, creating a faster, more innovative, and more engaging user experience. While many AI use cases today are narrow and tactical, they offer a clear view of future potential. Behind the scenes, AI is also improving IT operations—automating patching, enabling predictive analytics, and optimizing DaaS and VDI environments to deliver more resilient, scalable workspaces. However, AI adoption brings new challenges. Organizations must navigate trust, data governance, and the risks of "shadow AI," where employees adopt tools outside of IT's control. Looking ahead, the future of EUC lies in intelligent, unified AI agents that span platforms and devices—adapting in real-time to individual user needs. As AI becomes more embedded, it will power the next generation of secure, flexible, and personalized digital workspaces.

Digital Transformation

A significant shift in EUC is underway, driven by the broader wave of digital transformation and the strategic journey of rethinking how technology supports the business. Organizations are moving away from reliance on a single physical device and the rigid ties between hardware, operating systems, applications, and data. Today, computing can happen anywhere—securely and flexibly—without being confined to one machine. This evolution enables users to work across multiple devices while maintaining consistent access and security. It enhances mobility, simplifies management, and supports a more agile, responsive business environment. This shift involves modern identity, management, and decoupling of the application and data layers from the underlying hardware and operating systems. This separation allows for centralized control and flexible access, aligning closely with Hybrid Multi-Cloud, Cloud PC, DaaS, Progressive Web Apps (PWA), Web, SaaS, and Windows application availability across any device.

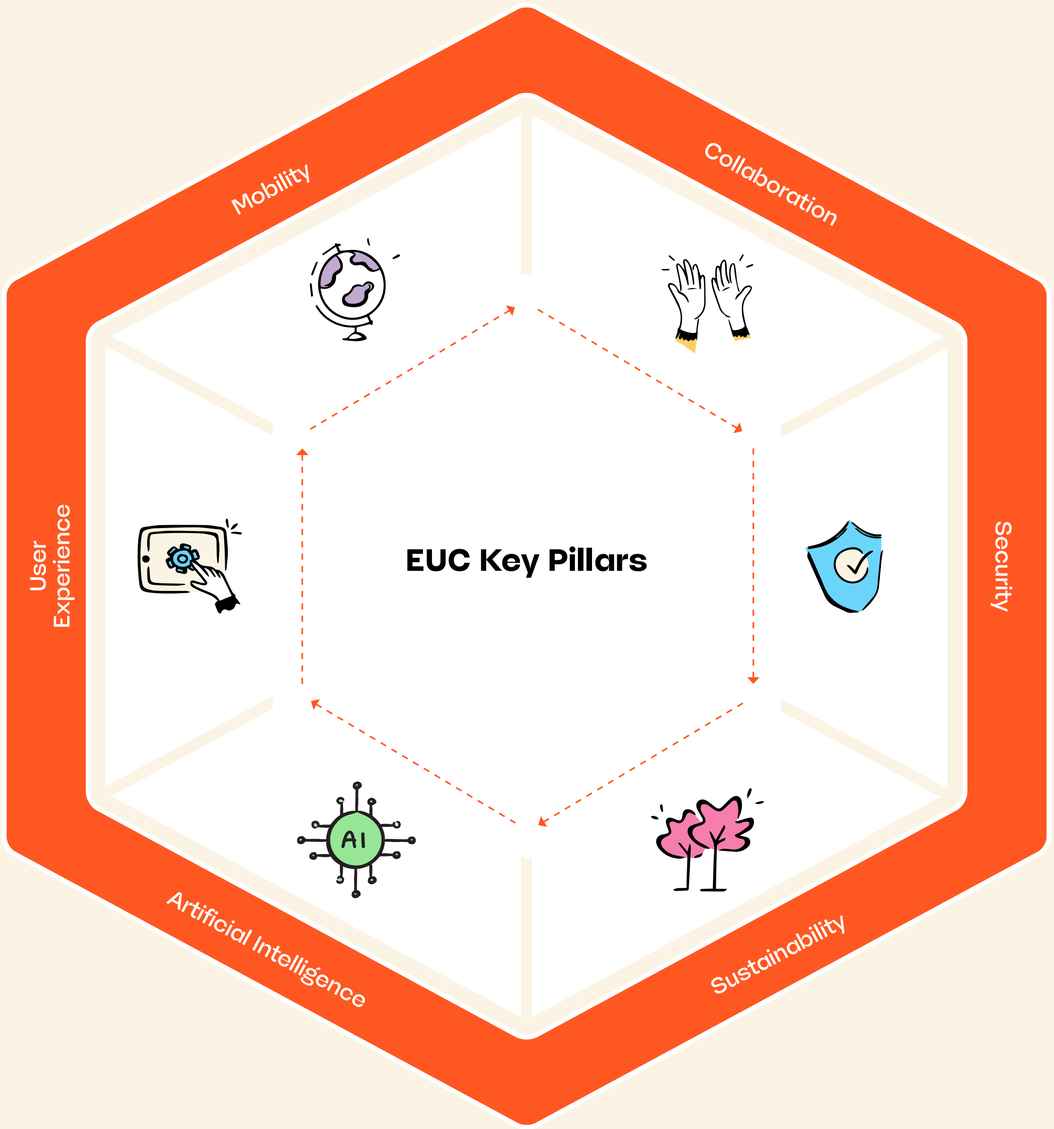
Digital innovation plays a key role in this transformation—the creative spark or tool that helps along the way. Whether AI-driven automation, secure browser access, or adaptive workspaces, these innovations accelerate the EUC journey and empower organizations to meet the demands of a modern, mobile, and distributed workforce.

Spatial Computing

Spatial computing transforms the EUC ecosystem by creating interactive, three-dimensional environments where digital and physical worlds converge seamlessly. This technology allows users to engage with digital content more naturally through gestures, voice commands, and movement—capabilities recently highlighted by devices like the Apple Vision Pro and Meta Quest. By integrating augmented reality (AR), virtual reality (VR), and mixed reality (MR), spatial computing elevates remote collaboration, making it more immersive and engaging. It also revolutionizes training by simulating real-world scenarios, enabling hands-on learning experiences without physical limitations. In addition, spatial computing introduces powerful new ways to visualize and manipulate complex data, particularly valuable in the architecture, engineering, construction, and design (AECD) industries. These capabilities streamline design workflows, enhance decision-making, and improve project outcomes. Ultimately, spatial computing makes interacting with digital tools as intuitive as engaging with the physical world. It opens new possibilities for collaboration, learning, and innovation, positioning it as a key enabler of future digital workplaces.

Why Understanding EUC Benefits Everyone in an Organization

Defined by six key pillars, User Experience, Mobility, Collaboration, Security, Sustainability, and Artificial Intelligence, EUC drives improvements that benefit individual users and the organization's core functions and strategic goals.



Benefits

User experience

User Experience (UX) is more than just visual design—it's about how users feel when interacting with technology. Great UX ensures systems are intuitive, efficient, and frictionless, allowing users to navigate, understand, and complete tasks easily. In the context of end-user computing, UX is critical. It boosts productivity, enhances job satisfaction, reduces support costs, lowers security risks, and encourages the adoption of new tools. UX isn't just about user preferences anymore; it's about strategic decision-making and competitive advantage. [ii]

A strong UX minimizes training needs and lets users focus on what matters most: their work. Ultimately, the best technology isn't defined by features alone, but by the experience it delivers; otherwise, the iPhone would never have overtaken the BlackBerry if it were only about features.

Mobility

Mobility in the context of end-user computing means accessing your applications and information from anywhere, using any device, anywhere. It's all about freeing you from having to be in a specific place to complete your work. This flexibility improves work-life balance – or work-life integration, makes it easier to collaborate with others no matter where they are securely, and helps ensure that work doesn't stop just because you're not in the office. Mobility in EUC has transformed the concept of work, leading to increased satisfaction and performance. A Gallup study indicates that hybrid is the preferred work environment of remote-capable employees.[iii]

Collaboration

Collaboration in end-user computing involves working with other people and AI agents, regardless of where everyone is located, using digital tools such as workspace AI, unified communication, document management, and spatial computing. Ideas can be shared more freely, projects can move forward faster, and everyone stays on the same page, making teamwork more effective and enjoyable. Collaboration is tackling the sheer volume of data available and facilitating its effective use. Zippia reports that companies promoting collaboration and communication at work have been linked to reducing employee turnover rates by 50%. Zippia also indicates that 75% of employees consider teamwork and collaboration important.[iv] By using AI's capabilities, organizations can get work done faster and filter and present information in a contextual, actionable way.

Benefits

Security

Security is a critical pillar of end-user computing—protecting personal and business data from theft, fraud, and unauthorized access. It safeguards privacy, builds trust with customers and partners, and ensures compliance with data protection regulations. Robust security also minimizes the risk of cyberattack downtime, enabling uninterrupted productivity. In EUC, secure access to any application and data is foundational. Solutions like Zero Trust Network Access (ZTNA) enforce strict identity-based controls, granting users access only to what they need - reducing the attack surface and supporting secure work from any device or location. However, it's essential to balance protection with usability. Focusing solely on security—without considering user experience or flexibility—can paradoxically weaken overall security. Proper EUC security integrates seamlessly into the user experience, allowing people to get work done confidently without barriers or compromise. According to Zipdo, 91% of cybersecurity professionals saw increased cyber-attacks due to remote work.[v] For security, customers must focus on the user experience. Also, keep it simple since complexity is the enemy of security.

Sustainability

Sustainability in end-user computing means using technology in environmentally friendly, resource-efficient ways. It involves developing and reusing devices, software, and services to reduce energy consumption and minimize waste, like recycling old devices and designing software requiring less power. Essentially, it's about ensuring that our growing reliance on technology doesn't lead to more pollution or exhaustion of natural resources, helping keep the Earth healthy and habitable for everyone. E-waste is the fastest-growing solid waste stream in the world. WHO reports that in 2019, an estimated 53.6 million tons of e-waste were produced globally, but only 17.4% was documented as formally collected and recycled[vi]. By incorporating sustainability into the device lifecycle, EUC can minimize the environmental impact of devices throughout their complete lifespan.

Artificial Intelligence

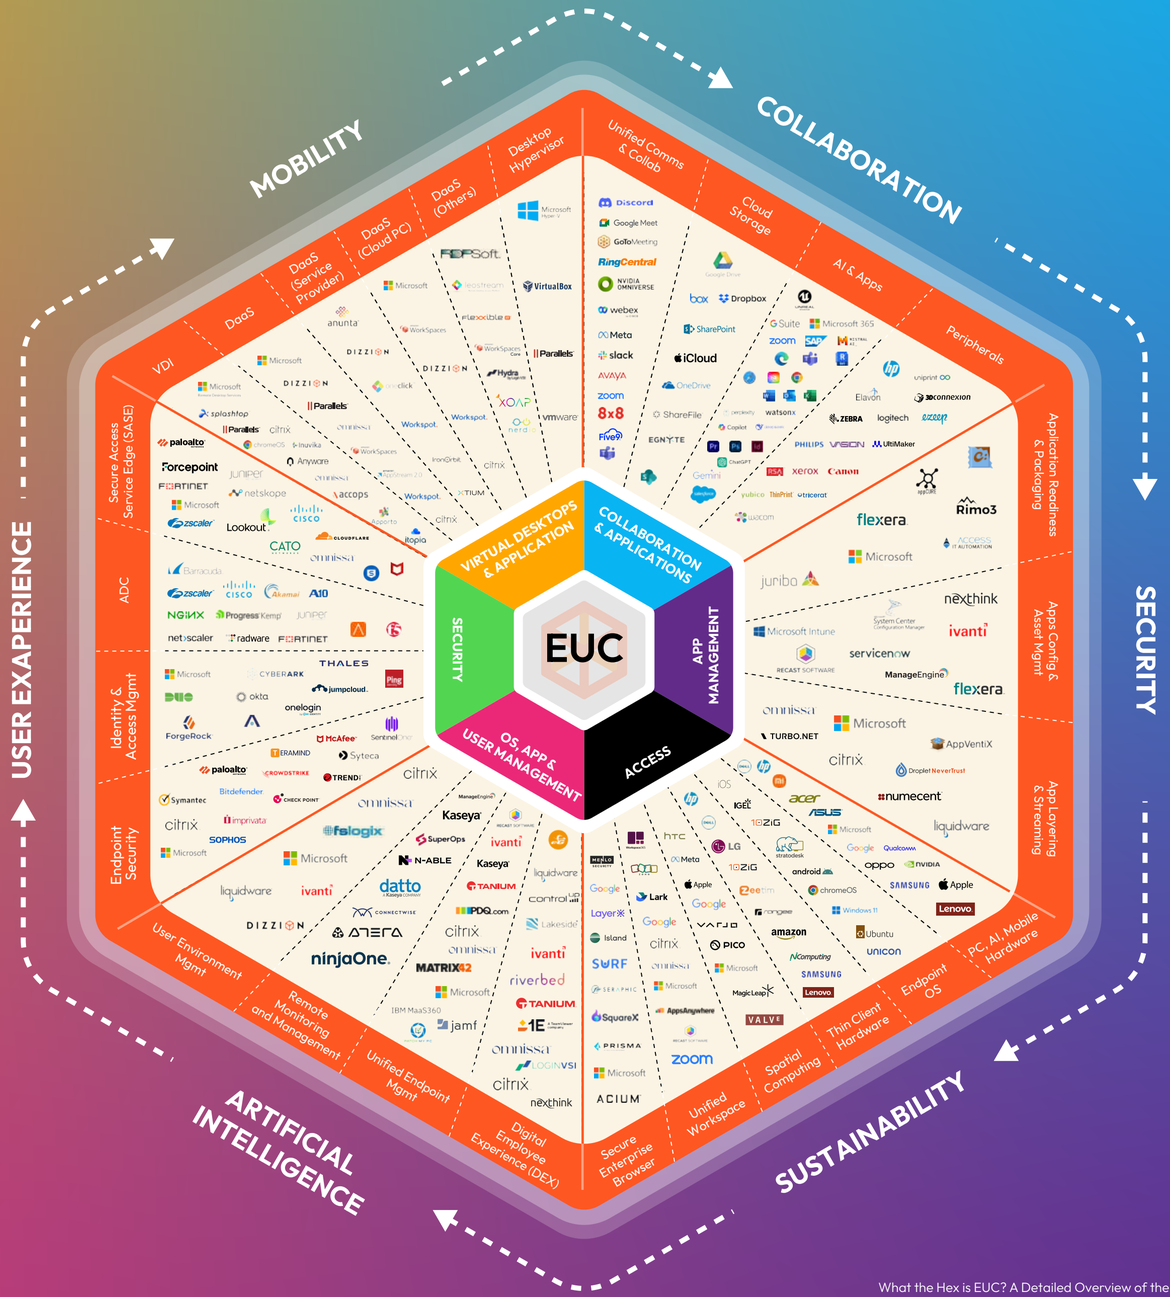
Workspace AI embeds artificial intelligence into the daily workflows, platforms, and tools that power modern organizations. It spans a wide range of capabilities—from intelligent agents like OpenAI's Sales Associate Agent, which autonomously handles sales workflows in natural language interfaces, to embedded productivity tools such as Microsoft Copilot and Google Workspace's smart features that assist with writing, scheduling, and data analysis. These solutions proactively eliminate repetitive tasks, surface insights, and adapt to user behavior to create a more fluid and personalized digital experience. The impact is tangible: AI is already boosting engagement, speeding up work, and reducing reliance on traditional UI-driven systems. According to a 2024 survey, 72% of businesses extensively using AI tools reported high organizational productivity, compared to 55% of those with limited AI use. In practical terms, AI-powered features in platforms like Google Workspace have led to a 35% improvement in productivity and a 40% reduction in email overload for businesses [vii]. AI adoption is often driven bottom-up by users solving real problems, being more productive, and using AI as a companion. In the EUC Hexagrid, Workspace AI spans multiple pillars—from User Experience and Collaboration to Mobility and Apps.

The EUC Hexagrid

The EUC Hexagrid by Dizzion provides a comprehensive overview of the EUC ecosystem designed to help IT professionals, decision-makers, and innovators navigate the complexities of the end-user computing landscape with confidence and clarity.

A Framework for Navigating Complexity

Take the lead in shaping the conversation around end-user computing with our unique 'EUC Hexagrid' infographic. Share it within your professional circles and on social media with the hashtag "#EUCHexagrid" and contribute to a growing, dynamic conversation. Your insights and interactions can help drive the future of EUC. Let's connect with the community and lead the discussion together.



White Hexagrid Hi-Res

Gradient Hexagrid Hi-Res

What is the EUC Hexagrid?

In an age where technology is a critical part of business strategy, understanding the complexities and future of your digital workspace infrastructure is necessary. If you're looking to unlock the full potential of your digital workspace, the EUC Hexagrid is your map to the world of end-user computing.

The EUC Hexagrid Unviled

Successfully navigating the end-user computing landscape requires more than surface-level awareness—it demands a structured understanding of its moving parts. The EUC Hexagrid delivers a unique and comprehensive visual framework that helps IT professionals, strategists, and technologists understand the entire EUC ecosystem. Whether you're leading EUC for a global enterprise or scaling up at a tech startup, Hexagrid helps you identify where your organization fits in, spot potential gaps, and evaluate new areas for growth or optimization.

What does the EUC Hexagrid show?

The Hexagrid comprises six foundational pillars defining the EUC stack: Access, 'Virtual Desktop and Applications,' 'Device, OS and user Management,' Security, App Management, 'Collaboration, AI, and applications.' Within these categories, the framework maps over 280 vendors across 27 sub-pillars, giving a clear, up-to-date snapshot of the EUC vendor ecosystem. Whether you're benchmarking tools, selecting new platforms, or refining your existing workspace architecture, the Hexagrid acts as a practical reference for evaluating your EUC landscape.

Mastering EUC with the Hexagrid

Integrating the EUC Hexagrid into your toolkit goes beyond simply staying current—it's about navigating the EUC landscape with clarity, precision, and strategic intent. Whether you're a hands-on IT professional, a digital workspace architect, or a CxO defining long-term direction, the Hexagrid is a practical guide to the EUC domain. It empowers faster vendor evaluations, sharper decision-making, and a clearer view of capability gaps across your environment. Note: The Hexagrid is a living framework. While it's comprehensive and well-researched, the EUC space is constantly evolving. We rely on feedback from the community to keep it accurate and current. If you have suggestions, corrections, or ideas, don't hesitate to reach out and contact the author.

Pillar 1: Access

In End-user computing context, “Access” refers to an end user’s ability to securely connect to local and remote applications, resources, and data. It enables work from anywhere, anytime, on any device—regardless of operating system, device type, or interface. Seamless access ensures users can stay productive in the office, at home, or on the go. As secure access becomes increasingly central to the digital experience, it plays a critical role in enabling flexibility, meeting evolving user expectations, and transforming how we work.

Access Sub-pillars

The table below highlights the six sub-pillars of Access and their purposes and benefits.

Subpillar	PC, AI, Mobile Hardware	Endpoint OS	Thin Client Hardware
Purposes & Benefits	PC, AI, and mobile hardware refer to physical devices like desktop computers, laptops, smartphones, and tablets that end-users use for work and personal tasks. These devices are essential for accessing local and remote applications, data, and (AI) services, enabling users to get work done. The hardware choice depends on the user’s needs, whether for more powerful processing (including NPUs), portability, or convenient access on the go, reflecting the diverse ways technology supports our daily activities.	Endpoint operating system (OS) is the software that runs on and manages the hardware of a PC, mobile, Thin Client, and spatial computer. It bridges the physical device and your applications, allowing them to run and perform tasks. Endpoint OS ensures smooth execution of applications and computing tasks with intuitive user interfaces, seamless integration with productivity apps, and platform-agnostic capabilities, enhancing user experience, security, and management.	Thin Client hardware provides a stripped-down computing environment that reduces hardware maintenance and enhances data security through centralized resource management. It is a lightweight computer designed to connect to a ‘virtual desktops and application’ solution. It can often run software as a service and web applications using a locally installed browser. Thin clients are often cost-effective, energy-efficient, and easier to manage than traditional PCs.
Main Vendors	hp, DELL, ASUS, SAMSUNG, Lenovo, Microsoft, Google, Apple	Linux, Apple, IGEL, Android, Microsoft, chromeOS	Lenovo, LG, aws, hp, DELL, Microsoft

Note: Logo placements do not reflect rankings in any way

Pillar 1: Access

In End-user computing context, “Access” refers to an end user’s ability to securely connect to local and remote applications, resources, and data. It enables work from anywhere, anytime, on any device—regardless of operating system, device type, or interface. Seamless access ensures users can stay productive in the office, at home, or on the go. As secure access becomes increasingly central to the digital experience, it plays a critical role in enabling flexibility, meeting evolving user expectations, and transforming how we work.

Subpillar	Spatial Computing (AR/VR/MR)	Unified Workspace	Enterprise Browser
Purposes & Benefits	Spatial computing includes augmented-, virtual-, and mixed realities, offers immersive experiences to end-users, and revolutionizes access beyond screens, transforming access into the virtual world. Spatial computing transforms how we work, learn, collaborate, and interact with other people, applications, and information, making it more immersive and intuitive	A unified workspace aggregates and integrates information, services, and applications into a single easy to use interface. This allows end-users to access everything they need to work effectively from any device, anywhere. It simplifies the user experience, enhances productivity, and supports flexibility by providing a single point of access to all work resources, making it easier to manage and switch between tasks.	A secure enterprise browser is purpose-built for business environments, offering enhanced security, policy enforcement, and governance tools embedded directly into the browser. Unlike traditional browsers, enterprise browsers are architected to deliver secure, compliant access to web, SaaS, and virtual applications and desktops. They help organizations manage user access, prevent data leakage, block malicious sites, and ensure adherence to corporate security policies—all while maintaining a familiar browsing experience. This makes them particularly effective for enabling secure access on unmanaged or BYOD devices, supporting third-party contractors, and implementing Zero Trust frameworks pace strategies.
Main Vendors	htc, Microsoft, Google, Meta, Apple, Magic Leap	AppsAnywhere, omnissa, Workspace365, RECAST SOFTWARE, citrix, Google, Microsoft	Island, PRISMA, Google, Microsoft, SURF

Note: Logo placements do not reflect rankings in any way

By understanding the Access pillar, you ensure users can securely connect to what they need, when they need it—without friction or compromise.

Pillar 2: Virtual Desktop and Applications

Understanding the landscape of Virtual Desktops and Applications is essential, as this computing model simplifies management, strengthens security, and enhances flexibility and scalability across the organization.

Sub-pillars Under Virtual Desktops and Applications

Discover virtual desktops' and applications' purposes and benefits through the table below.

Subpillar	VDI (Virtual Desktop Infrastructure)	DaaS (Desktop as a Service)	DaaS (Service Provider)
Purposes & Benefits	Virtual Desktop Infrastructure (VDI) is software designed, deployed, and managed by internal IT teams or managed service providers to deliver remote access to Windows desktops and applications. These virtual desktops run within virtual machines hosted primarily in on-premises or cloud-based data centers. Using a remote display protocol, the user interface—essentially the pixels—is streamed from the data center to the user's endpoint device. This allows users to securely access their virtual desktops and applications from any device, anywhere, as long as they have a decent network connection.	Desktop as a Service (DaaS) delivers remote virtual desktops and applications to end-users via virtual machines hosted in the cloud, on-premises, or both. These resources are accessed through a remote display protocol, allowing users to securely work from any device, anywhere—without being tied to a specific physical machine. DaaS is typically offered as a fully managed, cloud-native service. It's architected, operated, and maintained by a service provider, abstracting much of the underlying complexity. Organizations can consume DaaS as a turnkey solution or adopt it as a control plane platform, where the provider manages orchestration and delivery. At the same time, the customer configures and maintains the workload VMs. Depending on the provider's architecture, these virtual desktops can run in public, private, or hybrid environments. Most DaaS offerings follow a subscription-based or pay-per-use pricing model, aligning costs with usage and offering greater flexibility compared to traditional VDI deployments.	A DaaS provider delivers Desktop-as-a-Service solutions and manages the underlying infrastructure—including data storage, security, backups, scaling, and software updates. By outsourcing these backend responsibilities, organizations can offload operational complexity, reduce the burden on internal IT teams, and refocus resources on strategic initiatives and core business objectives.
Main Vendors	Microsoft, omnissa, Parallels, citrix	DIZZIN, citrix, aws, Microsoft, omnissa, Workspot	anunta, Workspot, DIZZIN, XTIUM

Note: Logo placements do not reflect rankings in any way

Pillar 2: Virtual Desktop and Applications

Understanding the landscape of Virtual Desktops and Applications is essential, as this computing model simplifies management, strengthens security, and enhances flexibility and scalability across the organization.

Subpillar	DaaS (Cloud PC)	DaaS (Others)	Desktop Hypervisor
Purposes & Benefits	A Cloud PC is a virtual desktop hosted in the cloud, accessible from any internet-connected device. It provides consistent, secure, and scalable personal desktop experience without relying on physical hardware. Apps, settings, and data reside in the cloud, enabling users to work from anywhere while IT centrally manages updates, security, and provisioning. Cloud PCs typically follow a flat-fee pricing model and are designed to be simple to use and manage—often using the same tools and processes as traditional physical PCs	DaaS (Others) are platforms or software tools that enable the automation, orchestration, deployment, management, and optimization of desktop-as-a-service solutions. These tools simplify IT management, allowing administrators to configure, manage, monitor, and run Desktop as a service. Often, DaaS tools fill gaps in the DaaS solution or provide infrastructure building blocks for DaaS.	A desktop hypervisor is software that allows multiple desktop operating systems to run on a single machine (the host) by creating and managing virtual machines. This enables developers, testers, and power users to run multiple operating systems or versions concurrently, aiding in testing and development scenarios
Main Vendors	Microsoft, citrix, aws, Workspot, DIZZION	WorkSpaces Core, leostream, nerdio, Hydra by Login VSI	Microsoft, ORACLE, Parallels, vmware

Note: Logo placements do not reflect rankings in any way

Virtual desktops and applications are transforming how IT supports flexible, secure, and user-centric work environments, enabling employees to work anytime, on any device, from any location.

Pillar 3: Device, OS, and User Management

The Device, Operating System, and User Management pillar includes both an end-user and a device-centric view. Solutions in this pillar can oversee and manage the physical PC, Virtual Desktops and Apps, mobile hardware computing devices, and their endpoint operating systems, streamlining IT operations and enhancing security. It also includes managing Windows user profiles and user environments in physical and virtual Windows desktop environments while measuring and monitoring employee satisfaction. This provides insights into how good a user's experience is in a digital world while predicting problems before IT and the end users see it.

Device, OS, and User Management Sub-pillars

Learn about the four sub-pillars under Device, OS, and User Management and how they can benefit your organization.

Subpillar	Digital Employee Experience (DEX)	Unified Endpoint Management (UEM)
Purposes & Benefits	Digital employee experience provides insights on how end-users perceive application and workspace performance. A good digital employee experience helps employees be more productive and satisfied with their jobs, as it minimizes frustrations related to technology and enables them to focus more on their actual work tasks. DEX monitors and provides operation insights to IT on how users interact and use the applications, physical and virtual environments, network, infrastructure, and cloud services. DEX is the transformation from IT-centric monitoring to user-centric measuring, analytics, and monitoring their perceived performance. With DEX, it is possible to predict the problem before IT (and the end-user) sees it, leading to increased productivity and satisfaction.	Unified endpoint management is software or services that IT teams use to manage endpoints from a single platform and interface. This makes deploying software, enforcing security policies, and updating systems easier. It reduces the complexity and costs of managing various devices, including PCs & mobile devices, spatial computing, and Internet of Things (IoT), while enhancing its security posture with the ability to remotely wipe data from lost or stolen devices and enforce security policies, like password protection and encryption
Main Vendors	1E, controlup, nexthink, omnissa, lakeside, riverbed	omnissa, Microsoft

Note: Logo placements do not reflect rankings in any way

This pillar impacts everything from employees' daily productivity to IT departments' overall operational efficiency. Understanding and implementing strategies around it can create a robust, scalable, and user-friendly computing environment that stands the test of technological advancements.

Pillar 3: Device, OS, and User Management

The Device, Operating System, and User Management pillar includes both an end-user and a device-centric view. Solutions in this pillar can oversee and manage the physical PC, Virtual Desktops and Apps, mobile hardware computing devices, and their endpoint operating systems, streamlining IT operations and enhancing security. It also includes managing Windows user profiles and user environments in physical and virtual Windows desktop environments while measuring and monitoring employee satisfaction. This provides insights into how good a user's experience is in a digital world while predicting problems before IT and the end users see it.

Device, OS, and User Management Sub-pillars

Learn about the four sub-pillars under Device, OS, and User Management and how they can benefit your organization.

Subpillar	End-User Environment Management	Remote Monitoring and Management (RMM)
Purposes & Benefits	End-user environment management is Windows software that allows IT administrators to manage the user's Workspace. These solutions can manage, secure, containerize, and personalize Windows operating systems, user profiles, and settings across physical and virtual desktops and applications. They help deliver consistent user experience, no matter where or how they access their desktops and applications.	Remote Monitoring and Management (RMM) enables IT teams to remotely monitor, manage, and support endpoints, servers, and network infrastructure. It provides real-time visibility into system health, automates routine tasks such as patching and updates, and proactively detects issues before they affect end-users. IT administrators can deploy software, enforce policies, run scripts, and perform remote troubleshooting—all without user intervention. RMM is critical for maintaining operational continuity and security across on-premises, cloud, and remote environments.
Main Vendors	ivanti, liquidware, omnissa, Microsoft, citrix	ninjaOne, datto (A Kaseya COMPANY), Kaseya, ATERA, ManageEngine

Note: Logo placements do not reflect rankings in any way

This pillar impacts everything from employees' daily productivity to IT departments' overall operational efficiency. Understanding and implementing strategies around it can create a robust, scalable, and user-friendly computing environment that stands the test of technological advancements.

Pillar 4: Security

As we increasingly depend on the digital workspace, the growing use, value, diversity, and volume of applications and corporate data have significantly expanded the threat surface. This evolution has made securing the digital workspace more complex and critical. In this Security pillar, we explore four essential components of a modern security framework designed to protect systems and data in today's interconnected world.

Security Sub-pillars

Security comprises four sub-pillars: Endpoint Security, Identity and Access Management (IAM), Application Delivery Controller (ADC) and Secure Access Service Edge (SASE).

Subpillar	Endpoint Security	Identity and Access Management (IAM)
Purposes & Benefits	Endpoint and Extended Detection and Response (EDR/XDR) solutions are designed to detect, investigate, and respond to security threats across endpoints, virtual apps, and desktops —and, in the case of XDR, across multiple security domains such as network, cloud, email, and servers. These platforms collect and analyze telemetry to identify suspicious behavior, enable real-time threat hunting, and automate response actions. EDR focuses on securing individual devices, while XDR extends visibility across the entire environment, correlating signals to detect complex, multi-stage attacks. They provide a comprehensive approach to threat detection and incident response in modern workspaces.	Identity and Access Management (IAM) ensures the right individuals have secure, appropriate access to applications, data, and systems across the organization. IAM defines and enforces who (identity) can access what (authorization), under which conditions. It prevents unauthorized access by managing user identities, authentication mechanisms (e.g., MFA, SSO), and access policies—supporting compliance, security, and operational efficiency.
Main Vendors	Microsoft, SOPHOS, SentinelOne, TREND, McAfee, CROWDSTRIKE	okta, Google, PING, Microsoft

Note: Logo placements do not reflect rankings in any way

Security is not just about protecting the network's perimeter; it's about intelligent, dynamic defenses that protect the digital workspace and the entire ecosystem. You lay the groundwork for a secure and resilient digital environment by mastering Endpoint and Extended Detection and Response and implementing IAM, and zero trust strategies.

Pillar 4: Security

As we increasingly depend on the digital workspace, the growing use, value, diversity, and volume of applications and corporate data have significantly expanded the threat surface. This evolution has made securing the digital workspace more complex and critical. In this Security pillar, we explore four essential components of a modern security framework designed to protect systems and data in today's interconnected world.

Security Sub-pillars

Security comprises four sub-pillars: Endpoint Security, Identity and Access Management (IAM), Application Delivery Controller (ADC) and Secure Access Service Edge (SASE

Subpillar	Application Delivery Controller (ADC)	Secure Access Service Edge (SASE)
Purposes & Benefits	Application Delivery Controllers (ADCs) are network appliances or software solutions that optimize, secure, and control traffic flow between end-users and backend applications. In end-user computing, ADCs manage client connections to web and SaaS applications, improving performance through load balancing, reducing latency, and ensuring high availability. They also enhance security with SSL offloading, traffic inspection, and policy enforcement.	Secure Access Service Edge (SASE) is a cloud-delivered architecture that converges network and security functions—including SD-WAN (Software-Defined Wide Area Networking), SWG (Secure Web Gateway), CASB (Cloud Access Security Broker), NGFW (Next-Generation Firewall), and ZTNA (Zero Trust Network Access)—into a single, unified service. SASE enables secure, low-latency access for end-users across branch offices, remote locations, and on-prem environments. It enforces zero trust principles by making access decisions based on user identity, device posture, real-time context, and compliance policies.
Main Vendors	f5, A10, Progress Kemp, netscaler	CATO, FORTINET, cisco, paloalto, zscaler

Note: Logo placements do not reflect rankings in any way

Security is not just about protecting the network's perimeter; it's about intelligent, dynamic defenses that protect the digital workspace and the entire ecosystem. You lay the groundwork for a secure and resilient digital environment by mastering Endpoint and Extended Detection and Response and implementing IAM, and zero trust strategies.

Pillar 5: App Management

App Management plays a pivotal role in the digital workspace. It provides end-users access to applications and IT processes and technology to analyze, package, deliver, configure, and manage applications for physical PC and mobile devices, virtual applications, and desktops.

App Management Sub-pillars

Delve into the table below and learn the purposes and benefits app management brings to your organization.

Subpillar	App Readiness and Packaging	App Configurations and Assets Management	App Layering and Streaming
Purposes & Benefits	Application compatibility, readiness, and packaging solutions ensure Windows applications run reliably across physical and virtual desktops. These tools support automated discovery, compatibility testing, (re)packaging, and deployment, reducing manual effort and accelerating migrations from legacy systems. They help IT teams validate performance and security requirements, improve reliability, and streamline application readiness across digital workspace environments.	Application configuration and asset management are essential for optimizing application usage and managing physical devices, mobile endpoints, and virtual desktops. Application configuration involves setting up applications based on specific user or business requirements to ensure optimal functionality. This includes customizing OS and application settings, defining user permissions, integrating with other systems, and enforcing security standards. Asset management refers to the tools and processes used to track and manage all end-user computing assets—such as physical devices, software licenses, subscriptions, and other resources.	Application layering, isolation, and streaming are techniques to package and deliver Windows applications flexibly and efficiently across physical and virtual desktops & apps. These methods isolate applications from the underlying operating system by placing them into containers or layers, allowing them to be attached or streamed on demand—without traditional installation. These approaches enhance flexibility, simplify management, and reduce operational overhead, especially in environments with diverse application needs. They help IT teams lower deployment complexity and maintenance costs while delivering a consistent user experience.
Main Vendors	Microsoft, flexera, Rimo3	Microsoft, RECAST SOFTWARE, nexthink	numecent, citrix, Microsoft, liquidware, omnissa

Note: Logo placements do not reflect rankings in any way

In a world where work happens everywhere, App Management is the invisible force that ensures every application is secure, available, and ready to power the digital workspace.

Pillar 6: Collaboration, AI and Applications

Collaboration and application tools have become indispensable for IT professionals and businesses because they enhance efficiency and connectivity. Seamless collaboration, secure cloud storage, and the integration of peripherals enable workplace innovation and flexibility.

Collaboration, AI and Applications Sub-pillars

The table below highlights the four sub-pillars of collaboration, AI, and application and how they benefit your business.

Subpillar	Cloud Storage	AI & Apps	Peripherals	Unified Comms & Collab
Purposes & Benefits	Cloud storage provides a centralized online space where users can store, access, and share data rather than using their local computer's storage solution or an organization's on-premises file servers. This enables end-users to access their files from any device, anywhere, facilitating collaboration and remote work. Cloud storage elevates data protection through redundancy and backup capabilities, ensuring data is easily recoverable and safe from hardware failures.	AI and Applications refer to the tools, services, and software that enable end-users and agents to get work done, perform tasks efficiently, and support their organizational roles. These solutions enhance productivity, decision-making, and collaboration across the digital workspace. With the rise of AI—such as 'copilots', intelligent automation, and generative AI—applications are becoming more context-aware, reducing manual effort and enabling faster, smarter workflows. AI-driven tools help users generate content, summarize data, automate repetitive tasks, and interact with systems through natural language, significantly improving the user experience.	Peripherals are external devices that connect to PCs and virtual desktop and application environments to extend their capabilities or provide additional functionalities. These can include devices like printers, smartcards, specialized keyboards, mice, and scanners for data entry.	Unified communication and collaboration solutions encompass voice and video calling, messaging, email, file sharing, real-time collaborative and unified workspaces, allowing employees to communicate and collaborate seamlessly, regardless of their location or the device they use. These solutions ensure that information flows smoothly across the organization, enabling teams to communicate and work more efficiently and effectively together.
Main Vendors	box, Apple, Dropbox, Google, Microsoft	Adobe, Office, Copilot, G Suite, ChatGPT, zoom, AUTODESK	hp, wacom, ZEBRA, logitech, UltiMaker	Teams, zoom, NVIDIA OMNIVERSE, AVAYA, slack, Discord

Note: Logo placements do not reflect rankings in any way

AI, applications, and collaboration tools empower skilled professionals to synchronize efforts and achieve greater outcomes. We're moving from a digital era defined by overload to a contextual era powered by AI—where relevance, automation, and focus drive productiv

The EUC Hexagrid as a Roadmap to the Future

As it continues to evolve, one thing is clear: **end-user computing is not just the future of work but the present reality.** Adopting the EUC Hexagrid as a roadmap allows you to realize a future-proof EUC strategy that aligns with your goals.

Revolutionize Your Workspace

With Dizzion's advanced DaaS and Cloud PC solutions, you're not just adopting new technology but elevating your entire business approach. Explore the ease and power of delivering virtual apps and desktops globally with a browser. Click below and Try Dizzion now!

> "End-user computing isn't just the future of work—it's the present reality of how work gets done."

Ruben Spruijt,
Field CTO & VP of Product
Dizzion

About the Author

Ruben Spruijt is Field CTO & VP of Product at Dizzion, a Visionary vendor in the Gartner Magic Quadrant for Desktop as a Service. In his multi-faceted role, Ruben is critical in shaping Dizzion's product and alliances strategy, keeping a pulse on industry trends, and providing industry thought leadership and insights to customers, partners, analysts, and peers. Ruben is a Microsoft Most Valuable Professional (MVP), NVIDIA Enterprise Platform Advisor (NEMA), and was in the Citrix Technical Professional (CTP) program and VMware vExpert for many years.

This tough mudder travels the world spreading tokens of knowledge hidden in stroopwafel from the land of Nether. Everywhere he travels, he shares information and sprouts understanding. He frames his experience in end-user computing so that others can learn the root of the technology, and what is most important in life
